ZOMATO INVOICE ANALYSIS

Restaurant Platform Expense Monitoring & Validation

Project Documentation

1. Project Overview

This project analyzes Zomato invoice data for three restaurant brands—Lemon Leaf, Forbidden Wok, and Paratha Ke Galli—across 2024, 2025, and 2026 year-to-date (YTD). Data-bricks SQL is used to prepare, consolidate, analyze, and validate the data. Microsoft Power BI is used to build interactive dashboards that communicate expense trends and validation findings to business stakeholders.

2. Business Problem Statement

Restaurant invoice information is distributed across multiple files and reporting periods. This makes it difficult to compare platform-related expenses across brands, monitor changes over time, understand the composition of invoice costs, and identify summaries that need further checking.

3. Project Objectives

- Consolidate invoice summaries for 2024, 2025, and 2026 YTD.
- Compare total invoice expenses and invoice counts across restaurant brands.
- Analyze Zomato commission, convenience fees, CGST, and SGST.
- Examine average invoice amounts and period-to-period changes.
- Build an interactive Power BI dashboard for management reporting.

4. Tools and Technologies

Tool	Role in the Project
Microsoft Excel	Source data
Databricks	Data platform
Databricks SQL	Querying and validation
Microsoft Power BI	Visualization and reporting

5. Methodology and Workflow

Step 1 — Data collection: Import the invoice data from Excel files into Databricks.

Step 2 — Data preparation: Clean summary fields and convert expense amounts into numeric values.

Step 3 — Consolidation: Combine the 2024, 2025, and 2026 YTD clean summaries using UNION ALL.

Step 4 — SQL analysis: Calculate totals, invoice counts, average invoice values, brand comparisons, and expense-component metrics.

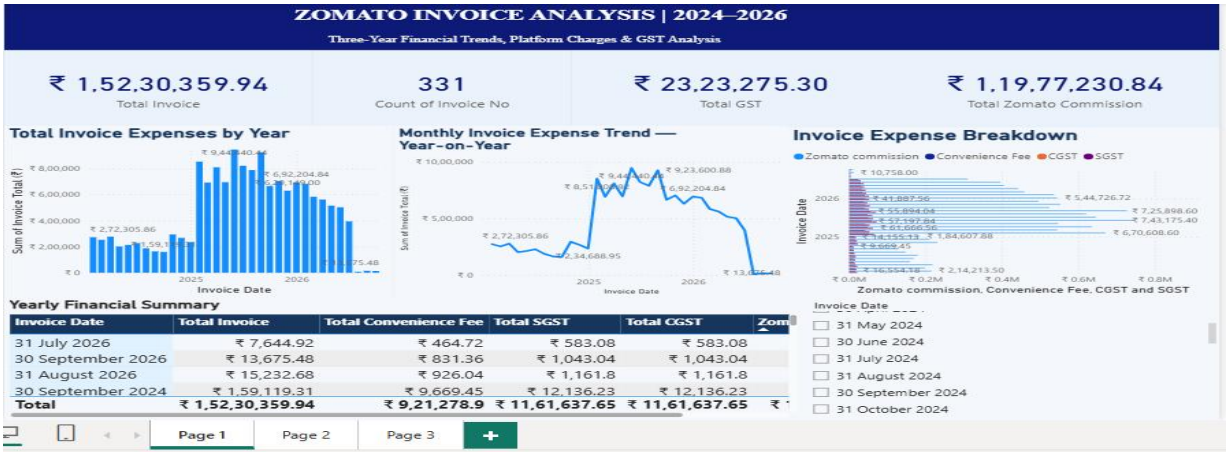

Step 5 — Power BI model: Load or connect to the prepared analytical data, confirm data types, and create relationships if multiple tables are used.

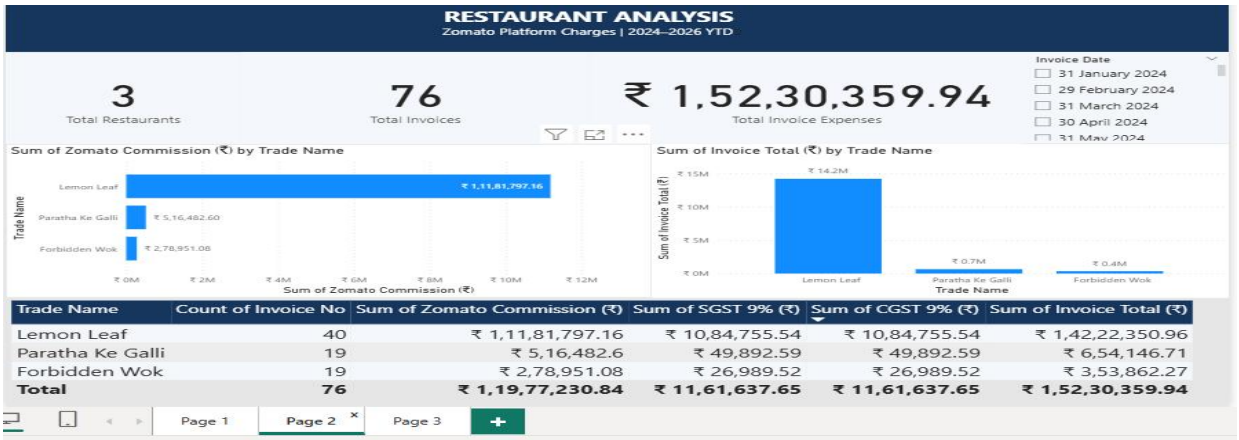

Step 6 — Dashboard development: Build KPI cards, comparative charts, brand filters, and a validation table in Power BI.

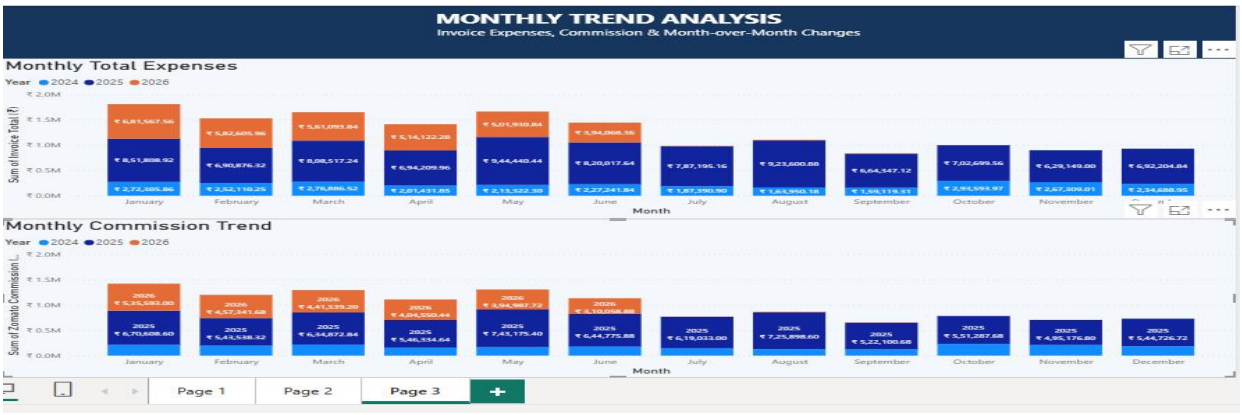

6. Key SQL Analysis Areas

- Overall invoice totals and invoice counts by period.
- Brand-wise invoice expense comparison.
- Average invoice total by brand and period.
- Expense composition: Zomato commission, convenience fee, and total GST (CGST + SGST).
- Invoice-total reconciliation and a summary validation status.

7.ScreenShot of Power BI Dashboard

8. Preliminary Findings

The following results were obtained from the current summary tables:

Period	Invoice Count	Total Invoice Amount
2024	31	₹27,49,350.94
2025	48	₹23,02,266.77
2026 YTD	27	₹8,17,985.48

- Lemon Leaf has the largest summarized invoice total among the three brands in each period.
- The 2025 summary has more invoices than 2024 but a lower total invoice amount.
- The 2026 YTD total covers only part of the year; it should not be compared with full-year totals without noting the difference in period coverage.
- Some taxable-amount differences require verification against original invoice records.
- Invoice-total differences observed in the summaries were small—within approximately ₹0.08 in absolute value.

9. Business Value

The combined Databricks SQL and Power BI workflow provides a repeatable way to monitor Zomato invoice expenses, compare restaurant brands, examine expense components, and direct attention to summaries that need validation. Interactive Power BI visuals make the findings easier to explore and communicate to business stakeholders.

10. Conclusion

This project demonstrates a practical analytics workflow: prepare and consolidate data in Databricks SQL, validate summary calculations, and communicate the results through Power BI dashboards. The analysis can support expense monitoring and reporting while preserving clear limits around profitability claims and partial-year comparisons.

11. Future Enhancements

- Add restaurant sales and operating-cost data if profitability analysis is required.
- Analyze least profit period and perform necessary operations with restaurant sales data.
- Implement sales data to get proper conclusion and reach business requirements.
